

Netgear NAS

| | |
|------------|--|
| Model Name | RN10400-100EUS |
| Serial | 3EP335E700C77 |
| | Last available firmware (think 6.9.3) Equipped with 2 HDD's ; Model: WDC WD30EFRX-68AX9N0 (2,7 TB); Configured as RAID 1; |

System has been shut down regularly at night time and booted automatically in the morning. 06/22/18 suddenly the system remains unbooted and the display showed an error msg (unfortunately I missed to note it); the power switch no longer worked; therefore I removed power via disconnecting the system from power and re-connected again - but the power switch did not work (to boot) (the “act”-light was on) ; the display remains dark.

Questions:

| # | Frage | | |
|---|--|--|--|
| 1 | Does it make sense to repair it (Who?, time line?, Calculated cost?) | | |
| 2 | How can I access the data? Can I access only one HDD to read the data? Or must I configure a RAID 1? My Debian-System could read an partition of an (formerly at RN10400-100EUS) USB-attached (backup-) drive – unfortunately couldn't find the backup part. | | |
| 3 | If I order a new System (let say ReadyNAS 212) – Can i only insert my HDD's and then have access to the data? Which System would you advise for this approach? | | |
| 4 | Which other approach to save the data would you advise? | | |
